

# ENVIRONMENTAL PRODUCT DECLARATION

*In accordance with EN 15804 and ISO 14025*

## WEBERCOL FIX

Date of issue: 2019-10-21

Validity: 5 years

Valid until: 2024-10-03

Scope of the EPD: United Arab Emirates

The **environmental impacts** of this product have been assessed over its **whole life cycle**. Its Environmental Product Declaration has been verified by an **independent third party**.

**weber**  
SAINT-GOBAIN

Registration number  
The International EPD® System:

S-P-01692

**EPD®**  
THE INTERNATIONAL EPD® SYSTEM

## General information

**Manufacturer:** Sodamco Emirates Factory For Building Materials L.L.C. P.O. Box 96082 Abu Dhabi UAE (Weber Saint-Gobain).

**Programme used:** The International EPD® System. More information at [www.environdec.com](http://www.environdec.com)

**PCR identification:** The International EPD® System PCR 2012:01 Construction products and construction services version 2.3.

**UN CPC Code:** 37510 Non-refractory mortars and concretes

**Owner of the declaration:** Sodamco Emirates Factory For Building Materials

**Product / product family name and manufacturer represented:** This EPD describes the environmental impacts of 1kg of cement-based tile adhesive – webercol fix manufactured at Sodamco site

**EPD® prepared by:** Mohamad Derbas (Sodamco Weber Saint-Gobain), Patricia Jiménez Diaz (Saint-Gobain LCA central team).

**Contact:** Mohamad Derbas, [Mohamad.derbas@saint-gobain.com](mailto:Mohamad.derbas@saint-gobain.com)

**Declaration issued:** 2019-10-21, **valid until:** 2024-10-03

**Demonstration of verification:** an independent verification of the declaration was made, according to ISO 14025:2010. This verification was external and conducted by a third party, based on the PCR mentioned above (see information below).

# Product description

## Product description and description of use:

webercol fix is a ready-mix cement-based tile adhesive for internal use.

webercol fix is polymer modified and water resistant with a strong bonding effect.

webercol fix can fix a wide range of ceramic tiles. It can be used to tile directly onto the following substrates:

- Concrete
- Stone walls (cleaned and prepared)
- Cementitious plaster and renders

webercol fix can be used for tiling in bathrooms, regular rooms, kitchens and stairs.

## Technical data/physical characteristics

|  |   |                              |
|--|---|------------------------------|
| VOC and formaldehyde content   | 2.5 g/LT  | ISO/FDIS 11890-2/GC-MS       |
| Open Time by Tensile Adhesion acc. (N/mm <sup>2</sup> )  | 5 minutes >0.5 (test for EN 12004:2007)                                 | (EN 12004:2007)              |
| Tensile Adhesion Strength (N/mm <sup>2</sup> )   | >0.6 (test for EN 12004:2007)   | (EN 12004:2007)              |
| Shear strength (N/mm <sup>2</sup> ) F-5.3.2 & F-5.3.3<br>25 kg webercol fix mixed with 1 liter weberad 225 MB + 4 liters clean water | 7 days standard conditions -> 0.7<br>28 days standard conditions -> 1.6 | ANSI 118.4 F-5.3.2 & F-5.3.3 |

## Description of the main product components and/or materials:

All raw materials contributing more than 5% to any environmental impact are listed in the following table.

| Component Category | Component specification | Amount (%) |
|--------------------|-------------------------|------------|
| Binder             | OPC type I              | 10-30%     |
| Filler             | Dune/Red sand           | 60-80%     |

| PARAMETER   | VALUE (expressed per declared unit)                                  |
|---|--|
| Quantity of mortar                                | 1 kg   |
| Packaging for the transportation and distribution | Polyethylene film: 0.33 g/kg<br>Paper bag: 8 g/kg<br>Pallet: 10 g/kg |
| Product used for the installation                 | Energy: 0.0079 MJ/kg<br>Water: 0.2 l/kg                              |

During the life cycle of the product any hazardous substance listed in the "Candidate List of Substances of Very High Concern (SVHC) for authorization" has been used in a percentage higher than 0.1% of the weight of the product.

The verifier and the program operator do not make any claim nor have any responsibility of the legality of the product.

# LCA calculation information

|  |   |
|--|---|
| <b>DECLARED UNIT</b>                         | 1 kg of webercol fix  |
| <b>SYSTEM BOUNDARIES</b>                     | Cradle to gate with options   |
| <b>REFERENCE SERVICE LIFE (RSL)</b>          | 50 years  |
| <b>CUT-OFF RULES</b>                         | Life Cycle Inventory data for a minimum of 99% of total inflows to the upstream and core module shall be included and at least 95% at the module level.<br>Flows related to human activities such as employee transport are excluded.<br>The construction of plants, production of machines and transportation systems are excluded |
| <b>ALLOCATIONS</b>                           | Based on mass repartition<br>The polluter pays and modularity principles have been followed.  |
| <b>GEOGRAPHICAL COVERAGE AND TIME PERIOD</b> | Data included is collected from one production site in ICAD3, SODAMCO EMIRATES and United Arab Emirates (UAE)<br>Production year from 2018<br>Background data: Ecoinvent (from 2015 to 2018) and GaBi (from 2013 to 2018)   |
| <b>PRODUCT CPC CODE</b>                      | 37510 Non-refractory mortars and concretes  |

According to EN 15804, EPD of construction products may not be comparable if they do not comply with this standard. According to ISO 21930, Environmental Product Declarations within the same product category from different programs may not be comparable.

## Life cycle stages

*Flow diagram of the Life Cycle*

Figure 1: Life Cycle illustration of a product for construction

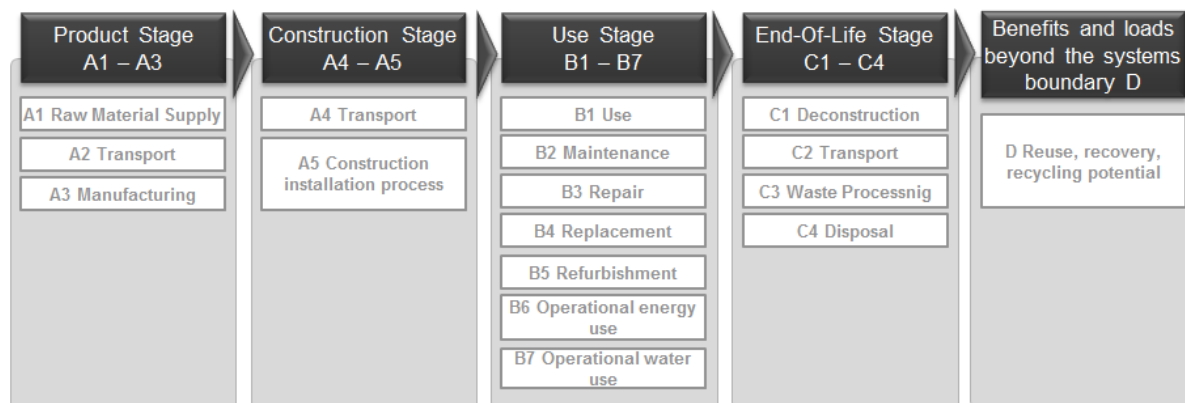

Figure 2: Cradle to gate with option analysis taking into account all stages of the Life Cycle product

## Product stage, A1 - A3

### Description of the stage:

The product stage of the Weber products is subdivided into 3 modules A1, A2 and A3 respectively “Raw material supply”, “transport” and “manufacturing”.

The aggregation of the modules A1, A2 and A3 is a possibility considered by the EN 15 804 standard. This rule is applied in this EPD.

#### **Raw material supply – A1**

This part takes into account the extraction and processing of all raw materials and energy which occurs upstream to the studied manufacturing process.

Specifically, the raw material supply covers sourcing (quarry) and production of all binder components and additives (e.g. sand, cement, rheology agent and others).

#### **Transport to manufacturer – A2**

The raw materials are transported to the manufacturing site. In this case, the modelling includes road and boat transportations (average values) of each raw material.

#### **Manufacture – A3**

This module includes manufacturing of products but also besides on-site activities such as drying, storing, mixing, packing and internal transportation.

The manufacturing process also collect data on the combustion of refinery products, such as diesel and gasoline, related to the production process.

Use of electricity, fuels and auxiliary materials in the production is taken into account too. The environmental profile of these energy carriers is modeled for local conditions.

Packaging-related flows in the production process and all up-stream packaging are included in the manufacturing module, i.e. wooden pallets, paper sack and LDPE film.

Apart from production of packaging material, the supply and transport of packaging material are also considered in the LCA model. They are reported and allocated to the module where the packaging is applied. Data on packaging waste created during this step are then generated.

It is assumed that packaging waste generated in the course of production and up-stream processes is 100% collected and either recycled or incinerated with energy recovery.

<sup>1</sup> Included Transport

## Construction process stage, A4 - A5

### Description of the stage:

#### Transport – A4

This module includes transport from the production gate to the building site.

Transport is calculated on the basis of a scenario with the parameters described in the following table.

#### Transport to the building site:

| PARAMETER  | VALUE (expressed per declared unit)   |
|--|---|
| Fuel type and consumption of vehicle or vehicle type used for transport e.g. long distance truck, boat, etc. | 49,5l per truck per 100km with payload 48t per 100 km and forward real load 40t |
| Distance   | 110 km  |
| Capacity utilisation (including empty returns)   | 91% capacity utilization in mass including 1 % of empty returns in mass         |
| Bulk density of transported products   | 1.55 kg/lit ± 0.05  |
| Volume capacity utilisation factor   | 1 (by default)  |

## Construction installation process – A5

For the implementation of the product, mixer pump equipment is generally used for high volume purposes. Smaller volumes are mixed and applied according to local circumstances. A pump is generally used. The energy to run different equipment has been accounted for in relation to the product type and different uses.

During installation and construction, 5 % of the material amount is estimated to be wasted through excess preparation and cleaning processes. The losses are considered as landfilled. Within module A5, site-related packaging waste processing is included in the LCA.

End-of-life of packaging materials is reported and allocated to the module where it arises.

As no factual data on waste treatment of packaging materials and leftovers of installation products from construction sites are available, they are considered 100 % collected and recycled. Wooden pallets are considered recycled in established systems.

### Installation in the building:

| PARAMETER   | VALUE (expressed per declared unit)  |
|---|--|
| secondary materials for installation (specified by materials)   | none   |
| Water use   | 0.2 liters/kg  |
| Other resource use  | none   |
| Quantitative description of energy type (regional mix) and consumption during the installation process  | 0.0079 MJ/kg (UAE mix)   |
| Wastage of materials on the building site before waste processing, generated by the product's installation (specified by type)  | 0.05 kg (5%)   |
| Output materials (specified by type) as results of waste processing at the building site e.g. of collection for recycling, for energy recovering, disposal (specified by route) | Polyethylene film: 0.33 g/kg<br>Paper bag: 8 g/kg<br>Pallet: 10 g/kg<br>Packaging and pallets are sent to recycled |
| Direct emissions to ambient air, soil and water   | none   |

## Use stage (excluding potential savings), B1 - B7

### Description of the stage:

The use stage is divided into the following modules:

Use – B1

Maintenance – B2

Repair – B3

Replacement – B4

Refurbishment – B5

Operational energy and water use – B6 and B7

Once installation is complete, no actions or technical operations are required during the use stages until the end of life stage. The product does not require any energy, water or material input to keep it in working order. Furthermore, it is not exposed to the indoor atmosphere of the building, nor is it in contact with the circulating water or the ground.

The product covered by this EPD does not require any maintenance as it is aimed for webercol fix. In addition, due to the product durability; maintenance, repair, replacement or restoration are irrelevant in the specified applications. Declared product performances therefore assume a working life that equals the building's lifetime. For this reason, no environmental loads are attributed to any of the modules between B1 and B5.

## End-of-life stage C1 - C4

### Description of the stage:

Landfill is considered to be the worst scenario.

The end-of-life stage is divided into the following modules:

#### **Deconstruction – C1**

The de-construction and/or dismantling of the product take part of the demolition of the entire building. In our case, the environmental impact is assumed to be very small and can be neglected.

#### **Transport to waste processing – C2**

The model use for the transportation is applied (cf. table below).

#### **Waste processing – C3**

The product is considered to be landfilled without reuse, recovery or recycling. It is classified as 'non-hazardous waste' in the European list of waste products.

#### **Disposal –C4**

The impact of landfill is taken into account according to available data.

### **Additional technical information of End-of-life:**

| PARAMETER  | VALUE (expressed per declared unit) / DESCRIPTION  |
|--|--|
| Collection process specified by type                       | 1 kg collected with mixed construction waste.  |
| Recovery system specified by type                          | 0% of waste  |
| Disposal specified by type                                 | 100 % (1 kg) product to municipal landfill   |
| Assumptions for scenario development (e.g. transportation) | Average truck trailer with 27t payload, diesel consumption 38L/100km ; 50km distance to landfill |

## Reuse/recovery/recycling potential, D

Post-consumer recycling scenarios are not considered within this EPD.

# LCA results

Description of the system boundary, X = Included in LCA, MND = Module Not Declared

CML 2001 has been used as the impact model. Specific data has been supplied by the plant, and generic data come from GABI and Ecoinvent databases.

All emissions to air, water, and soil, and all materials and energy used have been included.

Resume of the LCA data results are detailed on the following tables and they refer to a declared unit of 1kg of webercol fix.

| PRODUCT STAGE       |           |               | CONSTRUCTION STAGE |                                   | USE STAGE |             |        |             |               |                        |                       | END OF LIFE STAGE          |           |                  |          | BENEFITS AND LOADS BEYOND THE SYSTEM BOUNDARY |

## Environmental parameters description

---

### Environmental impacts

---

#### Global warming potential

The global warming potential of a gas refers to the total contribution to global warming resulting from the emission of one unit of that gas relative to one unit of the reference gas CO<sub>2</sub>, which is assigned a value of 1. For example, if CH<sub>4</sub> (methane) has a global warming potential of 21, it means that 1kg of methane has the same impact on climate change as 21kg of CO<sub>2</sub> and thus 1kg of CH<sub>4</sub> would count as 21kg of CO<sub>2</sub> equivalent.

#### Ozone Depletion

Ozone depletion is the destruction of the stratospheric ozone layer which shields the earth from UV radiation harmful to life.

#### Acidification potential

Acid depositions have negative impacts on natural ecosystems and the man-made environment, incl. buildings. The main sources for emissions of acidifying substances are agriculture and fossil fuel combustion used for electricity production, heating and transport.

#### Eutrophication potential

It corresponds to an excessive enrichment of waters and continental surfaces with nutrients, and the associated adverse biological effects.

#### Photochemical ozone creation

Chemical reactions brought about by the light energy of the sun. The reaction of nitrogen oxides with hydrocarbons in the presence of sunlight to form ozone is an example of a photochemical reaction. It corresponds to the pollution of the air at ground level.

#### Abiotic depletion potential for fossil and non-fossil resources

The abiotic depletion potential is the consumption of non-renewable resources, thereby lowering their availability for future generations.

### Resource Use

---

#### Use of primary energy resources

Renewable energy is energy from non-fossil sources (wind, solar, geothermal, etc).

Renewable resource is a resource that is grown, naturally replenished or naturally cleansed, on a human time scale.

Non-Renewable energy is energy from sources which are not defined as renewable energy sources.

Non-renewable resource is resource that exists in a finite amount that cannot be replenished on a human scale.

#### Use of secondary material

Secondary material is material recovered from previous use or from waste which substitutes primary materials. Materials recovered from previous use or from waste from one product system and used as an input in another product system are secondary materials (recycled scrap metal, recycled plastic, recycled wood chips, etc.)

#### Use of secondary fuels

Secondary fuel is fuel recovered from previous use or from waste which substitutes primary fuels. Any combustible material recovered from previous use or from waste from the previous product

system and used as a fuel in a following system is a secondary fuel (e.g. solvents, used tyres, used oil, etc.)

#### **Use of net fresh water**

Fresh water is naturally occurring water on the Earth's surface (ice, lakes, rivers, groundwater, etc.) It is generally characterized by having low concentrations of dissolved salts; the term specifically excludes seawater and brackish water.

### *Waste categories*

---

#### **Hazardous waste disposed**

This kind of waste poses substantial or potential threats to public health or the environment

#### **Non-hazardous waste disposed**

This kind of waste is a waste that can burn, produce chemical, physical or biological reaction but without being hazardous or toxic for human health (e.g. PE, PVC, PS, metals, non-treated wood, construction waste mixed with non-mineral waste without any hazardous substance inside, etc.).

#### **Radioactive waste disposed**

These kinds of wastes contain radioactive material. Radioactive wastes are usually by-products or nuclear power generation and other applications of nuclear fission or nuclear technology, such research and medicine. Radioactive waste is hazardous to most forms of life and the environment, and is regulated by government in order to protect human health and the environment.

### *Output flows*

---

#### **Components for re-use**

To re-use is to use again after it has been used: this includes conventional reuse where the item is used again for the same function and new-life reuse where it is used for a different function.

#### **Material for recycling**

In contrast with re-use, recycling is the breaking down of the used item into raw materials which are used to make new items.

#### **Materials for energy recovery**

It includes any technique or method of minimizing the input of energy to an overall system by the exchange of energy from one sub-system to another.

#### **Exported energy**

It relates to energy exported from waste incineration and landfill

# LCA results interpretation

The following figure refers to a declared unit of 1kg of webercol fix.

[1] This indicator corresponds to the abiotic depletion potential of fossil resources.

[2] This indicator corresponds to the total use of primary energy.

[3] This indicator corresponds to the use of net fresh water.

[4] This indicator corresponds to the sum of hazardous, non-hazardous and radioactive waste disposed.

## Comments:

With the graphic view above, it is possible to assess which steps of the LCA are the most impacting for the chosen indicators

- The main environmental impacts of the product life cycle come from extraction and processing of raw materials (A1-A3). The Product stage is responsible for over 84% of the impact for following indicators: Global Warming, Non-renewable resources consumption, Energy consumption and Water consumption.
- As expected, waste production is mainly generated (over 95 %) during the end-of-life stage with building demolition.
- Water is added at installation.
- The formula mix and distribution pattern have identifiable impacts on the total.

## Additional information

### Electricity description

| TYPE OF INFORMATION                         | DESCRIPTION   |
|---|---|
| Location                                    | Representative of average production in United Arab Emirates (2017)   |
| Geographical representativeness description | Split of energy sources in United Arab Emirates<br>- Natural gas: 92%<br>- Oil: 1%<br>- Photo: 0.2%<br>- Losses: 6.7% |
| Reference year                              | 2017  |
| Type of data set                            | Cradle to gate from Thinkstep   |
| Source                                      | International Energy Agency -2017   |

### Carbonation during use phase

The carbonation process that occurs during the use stage when the cement included in the mortar's recipe reacts with carbon dioxide (CO<sub>2</sub>) from the air and forms calcium carbonate is calculated based on the "EN 16757 – Sustainability of Construction Works - Environmental Product Declarations - Product Category Rules for Concrete and Concrete Elements".

Kg CO<sub>2</sub> uptaken during use stage is 0 because of webercol fix is used under tiles and for this application k factor is considered to be 0.

## Data Quality

**Scope:** United Arab Emirates

**Period:** 2018

Background information is taken from the GaBi or Ecoinvent database, trade association or suppliers data.

|                      |   |
|----------------------|---|
